## REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: The applicant amended the claims so that composition / heat seal layer consists essentially of a specific ethylene/ propylene copolymer made by metallocene catalysis. While the applicants did not specifically argue the merits of the term "consisting essentially of" as it relates to their film, it is clear from the applicants' arguments in the response, the specification, and in the interview dated 30 January 2007 that the presence of the Ziegler / Nata catalyzed polymer in the prior art composition would affect the basic and novel characteristics of the claimed invention as the second polymer would increase the haze of the film and raise the sealing temperature of the films.

2. The examiner cites a number of new patents, which have been made of record. The most relevant is US 2002/0004575. However, these polymer seem to have a much lower melting point than the claimed polymers [0054] as the seal initiation temperature typically higher than the melting point of a polymer as seal initiation occurs when at the point where the polymer softens. Additionally, the prior art polymer appears to be an elastic polymer having a low isotactic index and actually appear to be syndiotactic in nature; [0060] PP (mm) is an indication of a syndiotactic structure whereas PP (rr) is an indication of an isotactic structure. The polymers have a high PP (mm) content.
